In attention of ECOVILLAS LTD

We want to inform you that our company uses two types of wood treatment:

1. VACUUM/PRESSURE TREATMENT (AUTOCLAVE)

Chemical product used : TANALITH E

The wood material is introduced in the autoclave and then the vacuum is formed. Then fill the autoclave with a wood preservative solution – **Tanalith E** – and keep the wood for several hours (3 -5 hours) under pressure. Through this procedure the solution penetrates deep into wood, which can be used in places where it comes in direct contact with the soil or even dug into the ground.

The colour of the chemical product is brown or green, so if we have apparent wood, we can paint only with darker colors than the initial treatment color.

This treatment is especially recommended for non-visible items.

2. IMMERSION TREATMENT

Chemical product used : RESISTOL

The wood is submerged in a tank in which the chemical solution – **Resistol** – is introduced. The wood is left for about 20 minutes and then left to dry.

This treatment is colorless, after drying, the wood is finished and painted in any color.
